COL202 Quiz 2

TOTAL POINTS

4.5 / 5

QUESTION 1

Bandwidth 5 pts

1.1 Definition predicate 2/2

- √ 0 pts Correct
- **0.5 pts** Did not mention \$\$\exists f \in F\$\$ for which the predicate is true.
 - 0.5 pts Did not mention \$\$\forall (u, v) \in E\$\$
 - 2 pts Incorrect Predicate, one correct predicate is:

 $\$ \exists f \in \mathcal{F}: \forall (u,v) \in E: |f(u) - f(v)| \leq k\$\$

- 2 pts Did not attempt

1.2 The bandwidth of a cycle 2.5/3

- √ 0 pts Correct
 - $\textbf{0.5}\ \textbf{pts}$ Incorrect/No argument that bandwidth

cannot be 1

- 0.5 pts Did not follow proof guidlines
- 2 pts Did not show construction/Incorrect

Construction for bandwidth = 2

- **1 pts** DId not show proof of construction/Incorrect proof of construction
 - 3 pts Did not attempt
- 0.5 Point adjustment
 - Show for a general vertex that difference with neighbors is <= 2</p>

COL202: Discrete Mathematical Structures. I semester, 2022-23. Quiz 2, 12 September 2022, Maximum Marks: 5

Name

Ent. No.

Important: Answer within the boxes. Anything written outside the box will be treated as rough work.

Problem 1.1 (2 marks)

The bandwidth of a graph is defined as follows: Find a numbering of the vertices of a graph such that the maximum difference between the numbers assigned to two vertices connected by an edge in the graph is minimized. This minimum value is called the bandwidth of the graph. Write the following as a predicate: The bandwidth of G = (V, E) is at most k. You must use the following notation: \mathcal{F} is the set of functions from V to $\{1, \ldots, |V|\}$; bandwidth(G, k) is the name of the predicate you define.

bandwidth (GH=: fep (max (ff(x)-f(y))) < k (x,y eV)

Problem 1.2 (3 marks)

Prove that a cycle on n vertices has bandwidth 2.

4 6 4 5 3

To show that a cycle on n vertices how bandwidth, we will show that such a numbering exists and that a numbering does not exist such that bandwidth is 1.

To show bandwidth = 2:

Choose a starting vertex of and number it 1.

Number both of the neighbours 2 and 3.

Now keep numbering vertices such that the difference 2 3

bet ween its number and its neighbour is 2.

If n is even, there will be a last vertex renaining which 55

Can be numbered as IVI

Max. difference is still 2.

If n is odd, there will be two vertices left in the end 35

Which can be numbered such that difference is still 2. e). If 3

We have proved that such a numbering exists. 2 3

To show bandwith Cannot be 1:

It can only be 1 if all differences between vertices is 1. So if a Nentex is numbered as n, its neighbours would have to be numbered n+1 and n-1. Since n+1 already has a very hour n, its other neighbour would have to be numbered n+1 and n-1. Since n+1 already has a very hour n, its other neighbour would have to be n+2. Thus, from one vertex two paths emerge such that one has increasing numbers and other decreasing. Since no number can be a hoth puths, those cannot next. But in a cycle, those two paths next. It is a contradiction. Hence, proved.
